About Us »Clinically significant drug-drug interactions are major contributors to adverse drug events and are a significant public health burden. Most of these interactions are predictable, preventable and can be predicted early during drug development. However, clinical trials enrolling patients of diverse ethnic backgrounds are significant challenges. No one drug can be tested in patients of all ethnic backgrounds; rather, the drugs tested must be selected with respect to their pharmacology and pharmacokinetics (PK), and their safety for patients of different ethnic backgrounds must be shown prior to product licensing. Prescribing information (e.g. brochures, dosing guidelines, and physician education) may help guide physicians in prescribing such drugs safely. These variables typically are determined in a separate clinical trial conducted for a given ethnicity, regardless of the therapeutic efficacy. Thus, there is a need in the art for providing improved methods for predicting and assessing drug-drug interactions in varied patient populations, e.g. patients of multiple ethnicities.The impact of the red blood cell transfusion on the outcome of islet transplantation. Transplantation of isolated islets may become feasible for the treatment of type I diabetes mellitus if the success of the procedure could be improved. Since islet function and subsequent success depend on the number of available islets, successful islet transplantation is not possible if the islet mass is lower than 5,000 IEQ. However, in the human clinical setting, maximal efforts to obtain c6a93da74d
