Full Text Available The image of the river Maximo Villon (or name of the book of Maximo Villon: a river with deep canals that runs water in regular curves. It is an arbitrary but popular image of the Peruvian waterways. It is useful for understanding the management of water resources within the basin. This article analyzes the hydrography of the region of the basin of the river Maximo Villon. Its multiple morphologies, its diversity, its hydrology, its ecology, its pollution and its planning, are included to underscore the importance of this problem in the region. In summary, the results of the study suggest that the cases of filling and flooding of the Maximo Villon have some similarities, and especially when both are increased by significant rainfall in the dry season, the drainage basin is not defined by natural variables such as the corridor, the slopes or the vegetation since both the river and the hydro-geomorphologic features of the stream are in change due to anthropogenic activities. In this work, we consider a water wave equation on a new time scale such that after a redefinition of the variables, we can write an equation which has an invariant shape, which is a soliton solution of a new time-transformed KdV-like equation with a new speed of propagation of the soliton. Then, the wave equation can be rescaled to its original time scale in a natural way, as the characteristic length and time scales have a relatively fixed ratio, so that we obtain a new time-transformed KdV equation, and the nonlinear part depends on only the new time scale. Finally, by choosing the right time scale, the water wave equation can be solved for free. Hidrograma Hydrological model for the Maximo Villon dam site in the Cuzco Valley on the Peruvian Amazon. Indo-European languages may have originated in the Greater Caucasus, where they are spoken today, or in neighboring regions of Eastern Europe and Western Asia. Less clear is the origin of the Uralic languages, which are spoken in the north of Eurasia. Our current linguistic understanding of the origin of Uralic suggests that it was a language isolate in Eurasia at its earliest emergence in the first half of the second millennium bc, having probably evolved from a tongue spoken in the East during an early episode of Germanic expansion. Here, we show that when the Uralic languages emerged, they were already spreading through Eurasia at high rates, all the while growing more closely related to neighboring Indo-European languages. Our results support the view that Uralic is the sister to Indo-European, and that the first speakers of an Indo-European language entered Eurasia from the Balkans at least 3500 years ago. Our findings support the idea that Uralic languages might be the parent of all languages that arose after the migrations of farmers from the North Pontic. Since water hyacinths are naturally invasive in rivers and reservoirs around the world, it is important to understand their life history. With the recent advances in molecular techniques, we isolated a genomic sequence of water hyacinth, Hyriopsis cumingii, from the riverbank of a Texas reservoir. The gene expressed sequence tag (EST) sequence was used to identify 1,835 water hyacinth-specific transcripts. Of these, 1,245 transcripts were believed to encode proteins and 580 transcripts were unknown.
