When done, you'll have what's called a "shaded image," which is correct for display purposes. This makes it possible to display a single image around another image if needed. Elements can be set up to import scans within seconds, at which point photo-editing can begin. You can add pixels later via the Adjustment Brush, which is already familiar territory to Elements users. For example, there's a new Paint Bucket tool that lets you copy and paste pixel information, which isn't a feature many people are aware of. The Batch Region Grow tool also lets you open multiple photos at once. Photoshop lets you select images on your computer, and then let Photoshop work the magic.
